## **Evaluating Peri-operative Preferences of Bariatric Surgeons** in the Management of Immunosuppressive Therapy During Bariatric Surgery

**Suguni Aushadhi Loku Galappaththy**<sup>1</sup> and Nicole Fearing<sup>2</sup>, <sup>1</sup>University of Missouri Kansas City, Kansas City, MO, <sup>2</sup>HCA Menorah Medical Center, Overland Park, KS

Meeting: ACR Convergence 2022

Keywords: Biologicals, Disease-Modifying Antirheumatic Drugs (Dmards), obesity, surgery

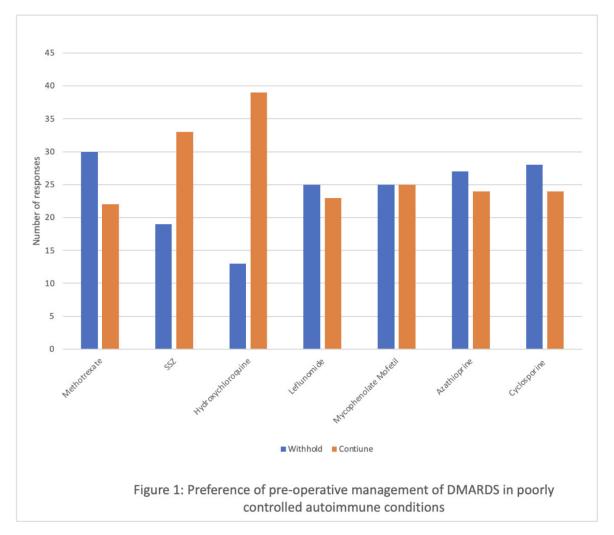

Figure 1: Preference of pre-operative management of DMARDs in poorly controlled autoimmune conditions

# XXVII IFSO World Congress

- Patient MM 35 year old female; Ht 160cm Wt 160kg BMI 62.5kg/m2
- Life long obesity, 99kg when graduating high school
- Family history of obesity, type IIDM, HT, OSA and IHD, multiple 1st degree relatives have previous bariatric surgery
- Psoriatic arthritis
  - Intermittent high dose steroids for flares
  - Currently takes mycophenolate with arthritis in "remission", previously severe arthritis with ambulation requiring 4WF, now can walk 100m
- Smoker 10 / day for 10 years
- Unsuccessful weight loss with multiple diets and intensive lifestyle modification, duromine, saxenda
- Abdominal pain (repeatedly) with Ozempic
- Can't afford mounjaro

# Conclusions

MBS in this group is

- Potentially very high benefit
- Likely to be much higher risk (including mortality)
- Consider tertiary or quaternary referral/ centralized referral

Practical tips

- Know / learn about each specific agent
- Know your rheumatology colleagues
- Procedure selection bearing in mind the natural history of medication usage in this group
