

How well do bariatric surgery patients objectively adhere to 24-hour movement guidelines preoperatively and what factors relate to better adherence?

Dale S. Bond, Yin Wu,
Isabel Michalak, Aurélie Baillot,
Michael Stevens, Godfrey Pearlson,
Darren Tishler, Pavlos K. Papasavas

I have no potential conflict of interest to report

I have the following potential conflict(s) of interest to report:

Patients who undergo MBS are expected to adhere to multiple health behavior recommendations that are designed to:

1. optimize health before surgery; and
2. enhance/sustain weight loss and health improvements after surgery.

**One of these behaviors is
physical activity (PA)**

Singular focus on MVPA neglects the potential clinical importance of other movement behaviors that occur during the 24-hour day.

The Whole Day Matters – 24-hour Healthy Movement Cycle

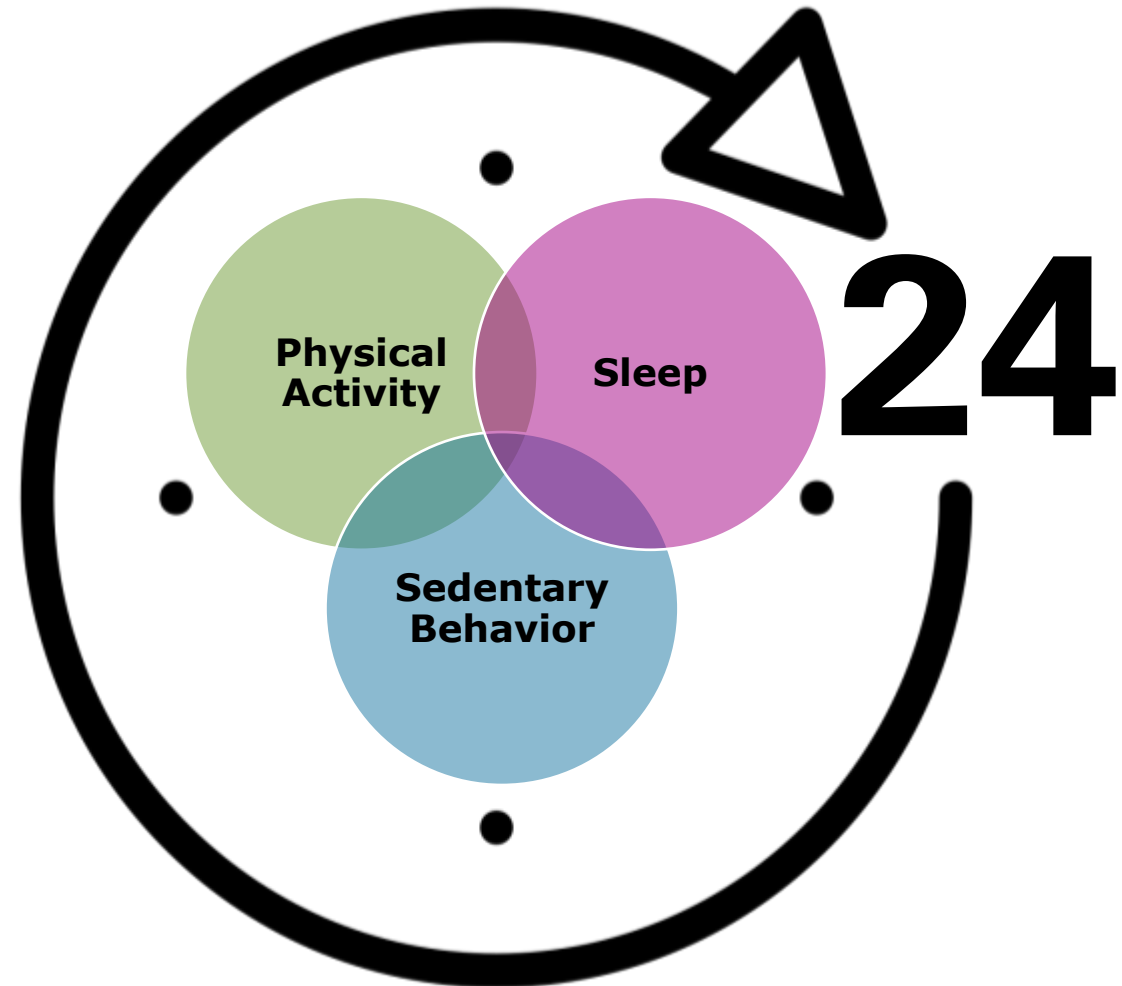

- ≥150 min/wk of moderate to vigorous aerobic physical activities; muscle strengthening activities 2x/wk

- 7-9 hours of good quality sleep on a regular basis, with consistent bed and wake-up times

- Limiting sedentary time to <8 hours with <3 hours of recreational screen time and breaking up long periods of sitting as often as possible

STUDY AIMS

1

Examine objectively-measured adherence (overall & degree) to 24-h movement guidelines

2

Examine sociodemographic and anthropometric correlates of adherence

METHODS: PARTICIPANTS

Adults scheduled to undergo SG who were enrolled in NIH-funded study focused on identifying neuroimaging and behavioral predictors of SG outcomes

METHODS: PROCEDURES

Wore Actigraph monitor 24 hours/day for 7 days

Surgery

METHODS: ANALYSIS

Aim 1: Adherence to movement behavior targets: (1) overall and (2) degree

1. %'s of participants who met movement targets (MVPA [both total and in >10-min bouts], ST, and sleep)
2. Index scores to represent degree of adherence to each of the recommendations + a composite of recommendations
 - e.g., For total MVPA target, a score of +1 = MVPA exceeded the target by 10% vs. a score of -1 = MVPA fell 10% short of meeting target

Aim 2: Associations of sociodemographic (age, sex, race, and ethnicity) and anthropometric (BMI) characteristics with adherence via multiple linear regression

RESULTS (1)

Participant Characteristics (N=103)

- 81% women
- 40.3 ± 9.1 years old
- 44% Non-White race
- 21.4% Hispanic ethnicity
- BMI = 45.3 ± 6.5 kg/m²

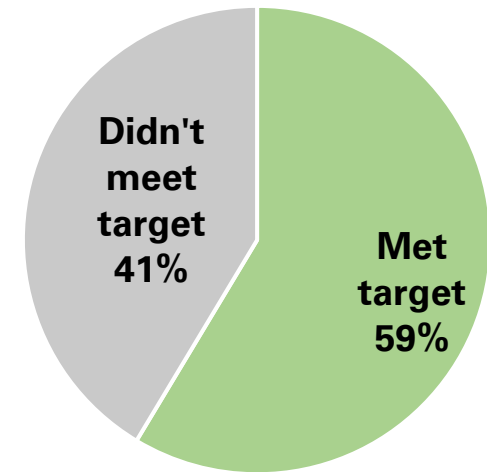

RESULTS (2)

**Total
MVPA**

Mean min/wk = 214.0 ± 150.9

**Overall adherence to 150 total
MVPA min/wk target**

Degree of Adherence

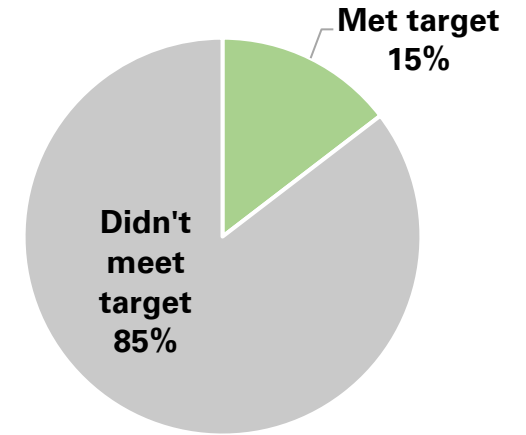

**Bouted
MVPA**

RESULTS (3)

Mean min/wk = 65.4 ± 87.2

Overall adherence to 150
bouted MVPA min/wk target

Degree of Adherence

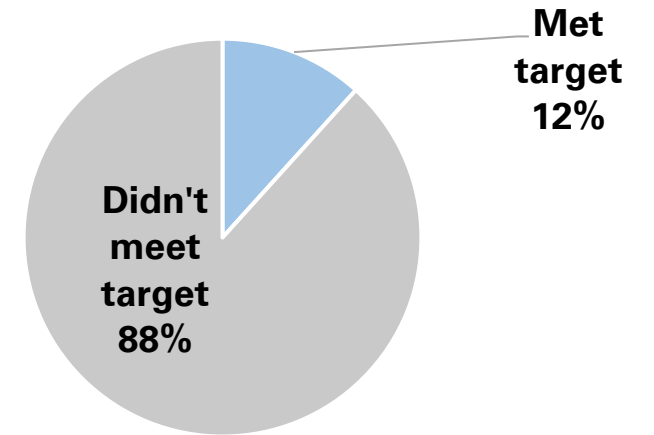

**NAPOLI
2023**

RESULTS (4)

Mean hours/day = 13.2 ± 3.3

Overall adherence to <9 ST hours/day target*

Degree of Adherence

*Target = 9 hrs. when measured objectively; Ross, et al. *Appl Physiol Nutr Metab* 2020

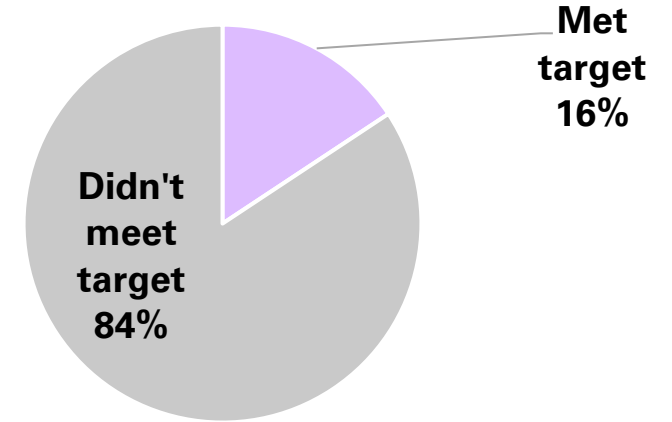

RESULTS (5)

Sleep

Mean hours/night = 5.7 ± 1.6

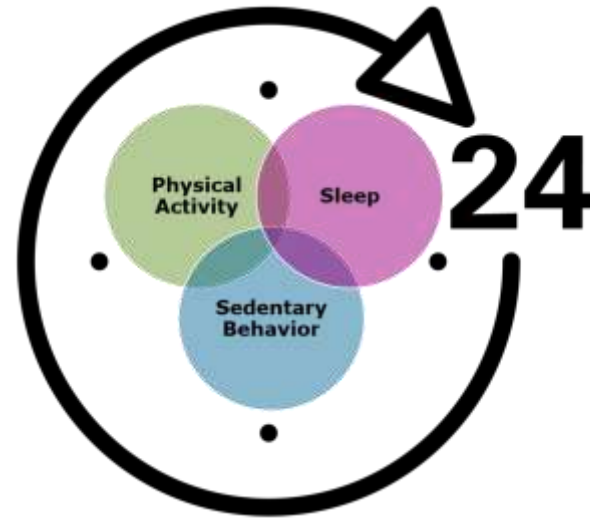

Overall adherence to 7-9 hours/night sleep target

Degree of Adherence

RESULTS (6)

Degree of Adherence to Composite of Movement Targets

RESULTS (7)

Sociodemographic characteristics and BMI were not associated with adherence to movement behavior targets

DISCUSSION/SUMMARY

- Preoperatively, MBS patients on average demonstrated:
 - High adherence to total MVPA target
 - Low adherence to individual bouts MVPA, ST, and sleep targets and composite of all targets

Total MVPA

Bouted MVPA

ST

Sleep

All

IMPLICATIONS/FUTURE DIRECTIONS

- Need ↑ clinical focus on all movement behaviors
- Identification of modifiable targets to help promote better adherence to recommended targets
- Can we improve adherence before and after MBS?
- Does improved adherence translate into better MBS outcomes?
