COI Statement

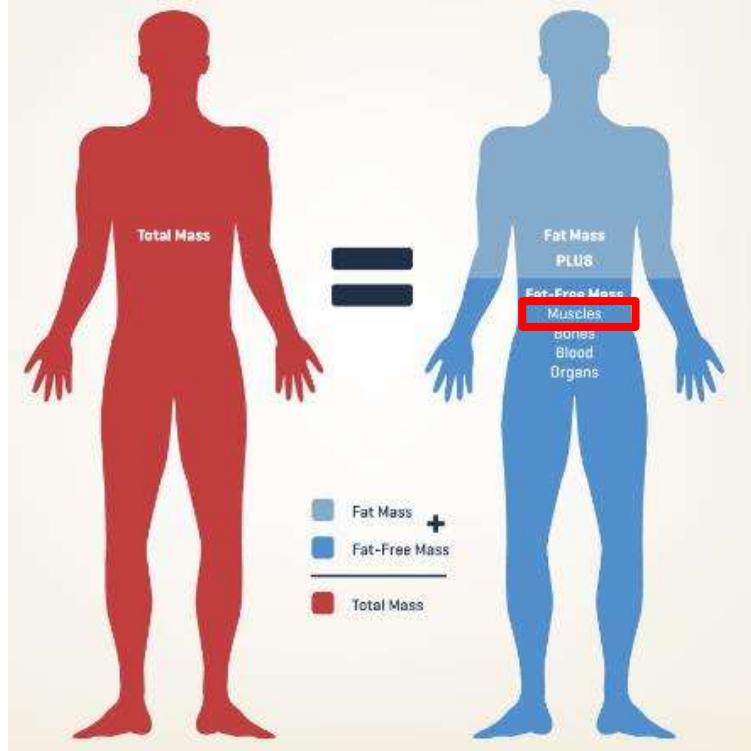

- No conflicts of interest need to be disclosed

Fat-free mass (FFM)

Skeletal muscle

- Physical movement
- Thermoregulation
- Bone (re)modelling
- Glucose regulation

Loss of FFM

- 3-14 kg in 12 months after bariatric metabolic surgery
- Effect of surgery-induced FFM loss on cardiorespiratory fitness/clinical outcomes?
- No sex-specific outcome data

Model 1 & 2: crude models

Model 3: Comparison of association between groups (reference category men)

Model 4: Model 3 adjusted for groups, preoperative BMI, preoperative FFM and follow-up moment (reference category men)

Model 5: Comparison of association between groups (reference category men)

Model 6: Model 5 adjusted for preoperative BMI, preoperative FFM and moment of inclusion (reference category men)

Conclusion

- All patients lost a substantial amount of FFM after BMS
- Proportion of FFM loss to total weight loss was significantly lower in premenopausal than in postmenopausal women and men
- No sex differences in the association between surgery induced FFM loss and postoperative CRF
