The “Sodium-glucose co-transporter 1 （SGLT1） Bridge” As An Indication For “Surgical Diabetes”

Dr. Hengliang Zhu
& Zefeng Xia
朱恒梁，夏泽锋
2023

Background

- **Bottleneck constraints：Indications to diabetic surgery**
- **The therapeutic mechanisms on diabetes after Metabolic & Bariatric Surgery(MBS) are not fully understood**

✓ The entero-insular axis (EIA) theory is questioned (including our previous studies)

✓ The theory of gut - brain - liver axis (GLBA) remains controversial.

✓ ***SGLT1 plays an important role in the therapeutic mechanisms on diabetes after MBS***

- Glucose absorption mainly depends on SGLT-1, and SGLT-1 is highly expressed in diabetic patients
- The effect of glucagon-like peptode-1(GLP-1) on glucose metabolism cannot well played in the absence of SGLT1
- MBS regulates the gluconeogenesis pathway that might be mediated by SGLT1

Bottleneck Constraints: Indications to diabetic surgery

- More than 16 prediction models, up to 2021.
- DiaRem and ABCD: the two most widely validated models to predict diabetes remission following bariatric surgery.

- The most externally validated models were ABCD and DiaRem. Although the ABCD and DiaRem models were primarily developed for predicting diabetes remission at 1-year follow-up, they have been validated in studies **predicting long-term** diabetes remission.

Table 1—Model development studies with their predictors

Prediction model	Predictors included	Discrimination (AUC) in model development studies	Discrimination (AUC) in external validation studies
ABCD; Lee et al. (16), 2013	Age, BMI, C-peptide, and diabetes duration	0.792 (0.728–0.856)*	Fig. 2*A*, *C*, and *E*

Prediction models: DiaRem & ABCD

- **DiaRem (Diabetes Remission Clinical Score):**
- Age,
- HbA1c,
- diabetes medication other than metformin,
- and insulin use.

- **“ABCD” score system:**
- Age（A），
- BMI(B)，
- C-peptide（C），
- Duration of diabetes（D）.

Prediction of remission

Predicting success of metabolic surgery: age, body mass index, C-peptide, and duration score

Variable	0	1	2	3
Age	>40	<40		
BMI	<27	27-34.9	35-41.9	>42
C-peptide (mmol/L)	<2	2-2.9	3-4.9	>5
Duration of DM (years)	>8	4-8	1-3.9	<1

Different procedure has different strength

ABCD score	HbA1c<6% (complete) (%)	HbA1c<6.5%(partial) (%)
0	5.9	5.9
1	5.0	20.0
2	26.3	38.6
3	31.9	42.0
4	52.5	67.8
5	55.4	75.0
6	61.7	78.3
7	77.0	92.3
8	85.2	96.3
9	87.1	87.1
10	93.3	93.3
Overall	52.2	64.7

“Surgical Diabetes” need to be redefined

Indication to diabetic surgery:

Besides the clinic indexes that in “ABCD” & DiaRem system

——There shoule be other variables that could influence diabetic remission rate.

“Surgical Diabetes” needs to be redefined.

"Surgical Diabetes" lacks ideal screening indicators,

which is likely due to the inconclusive therapeutic mechanism of diabetic surgery.

Sodium-glucose co-transporter 1 (SGLT1) differentially regulates gluconeogenesis and GLP-1 receptor (GLP-1R) expression in different diabetic rats: a preliminary validation of the hypothesis of "SGLT1 bridge" as an indication for "surgical diabetes"

Hengliang Zhu[1,2^], Huajie Cai[3], Xiaokun Wang[4], Tao Chen[1], Chaohui Zhen[2], Zhenzhan Zhang[1], Xiaojiao Ruan[3], Guoxin Li[1]

Ann Transl Med, 2022;10(8):481.

Preliminary validation of "SGLT1 Bridge" Hypothesis;
Initiatively raise up: "Surgical Diabetes".

Background: Sodium-glucose co-transporter 1 (SGLT1) may play a synergistic role in gluconeogenesis

The EIA theory has been questioned

- GLP-1 secretion is not in proportion to diabetes remission.
- GLP-1(R) agonists are far less effective than RYGB.
- Our previous studies: GLP-1 may only be the intermediate link in the therapeutic mechanisms involved in diabetes after MBS.

Abstract

GLP-1 is merely an intermediate link? !

The theory of gut - brain - liver axis (GLBA) remains controversial

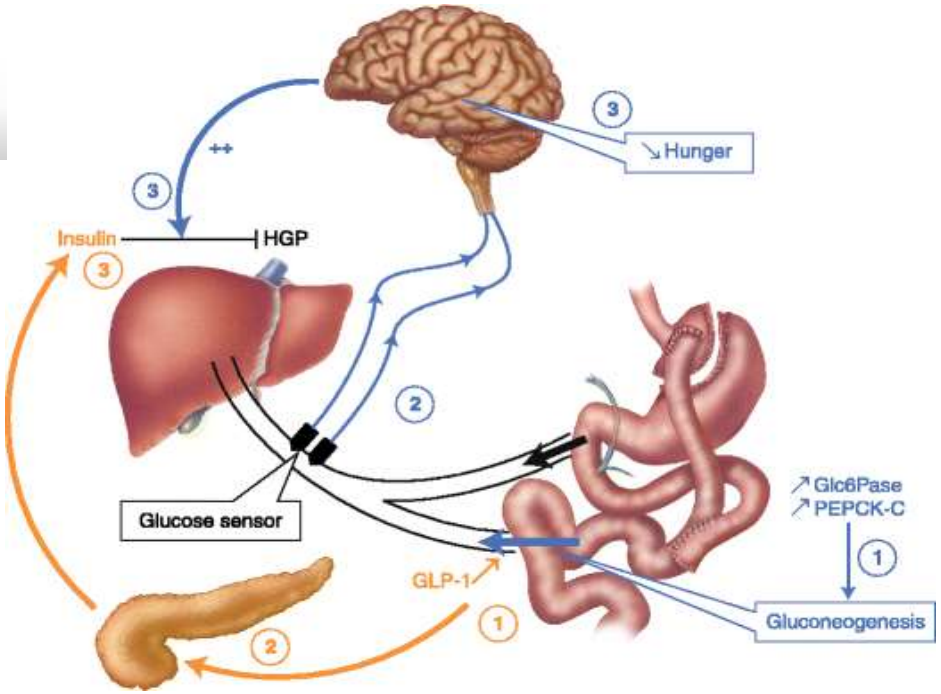
•The main physiological significance of gluconeogenesis(GNG) is to ensure a relatively constant blood glucose level in the presence of starvation.

•Belongs to endogenous glucose production (EGP), usually refers to liver gluconeogenesis (HGNG);

• Intestinal gluconeogenesis (IGNG) significantly enhanced in starvation state, accounting for more than 20% of the effective response of GNG.

GBLA： starts with IGNG and ends with HGNG

It is controversial due to the lack of differences in glucose metabolism between RYGB groups with or without vagus nerve preservation, which makes the gut-brain-liver axis (GBLA) theory questionable to explain the surgical treatment mechanism.

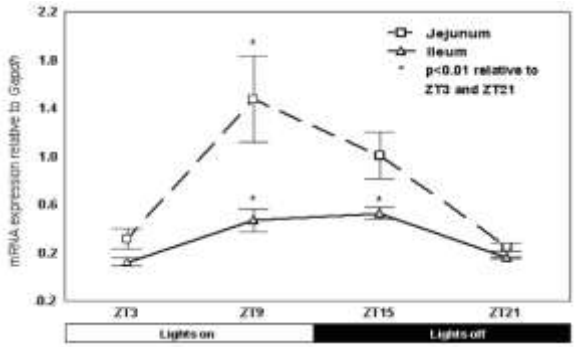


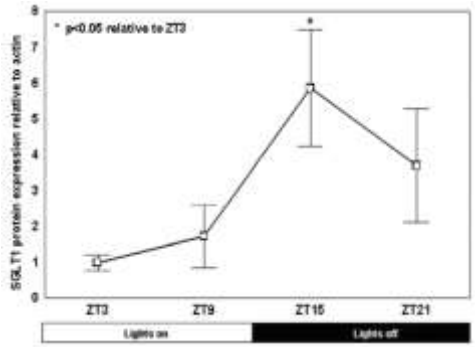
Intestinal Glu-Portal glucose signal（PGS）-Vagus N -Hypothalamus-Liver (EGP)

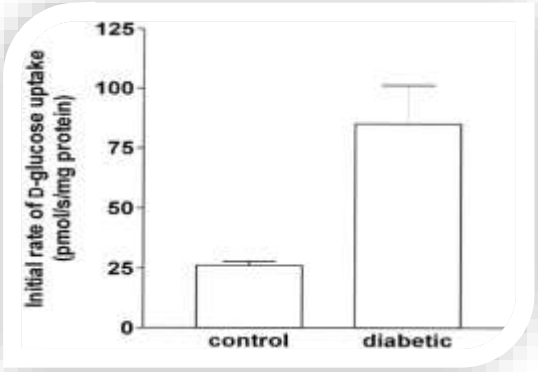
Nutr Hosp. 2013; 28(Supl. 2):109-114.

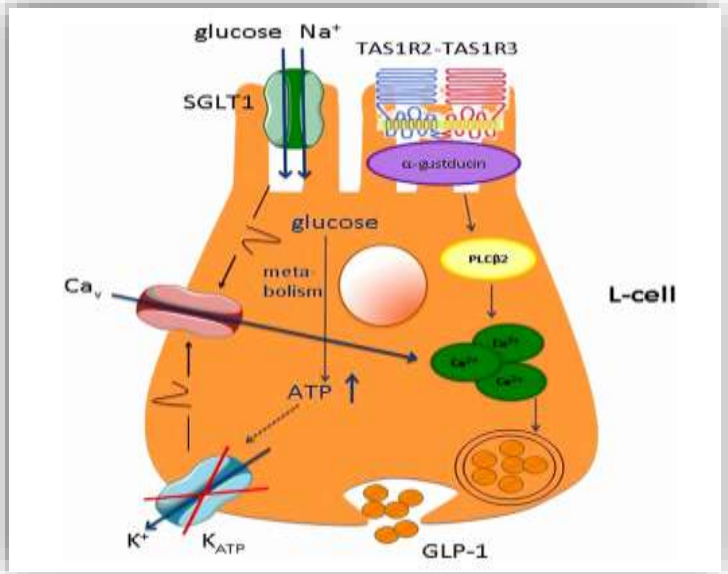
Sodium-glucose co-transporter 1 (SGLT1)

- SGLT1: the main factor of intestinal glucose absorption, with obvious circadian rhythm.
- SGLT1 mainly located in duodenum; lesser distributed in the distal bowel
- SGLT1 is highly expressed (2-3 times) in the diabetic patients's GI tract.
- Regulation of GLP-1 expression by SGLT1 has been demonstrated (at the cellular level) .







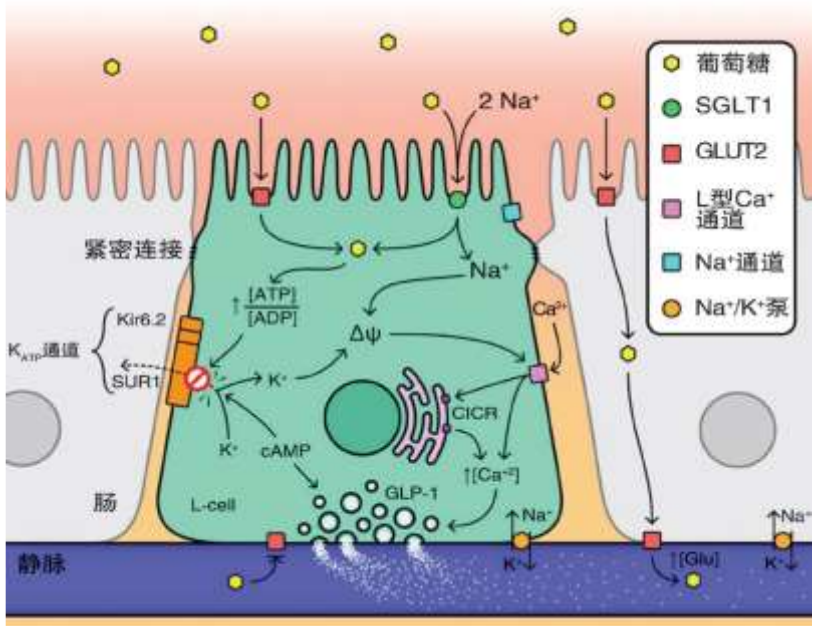


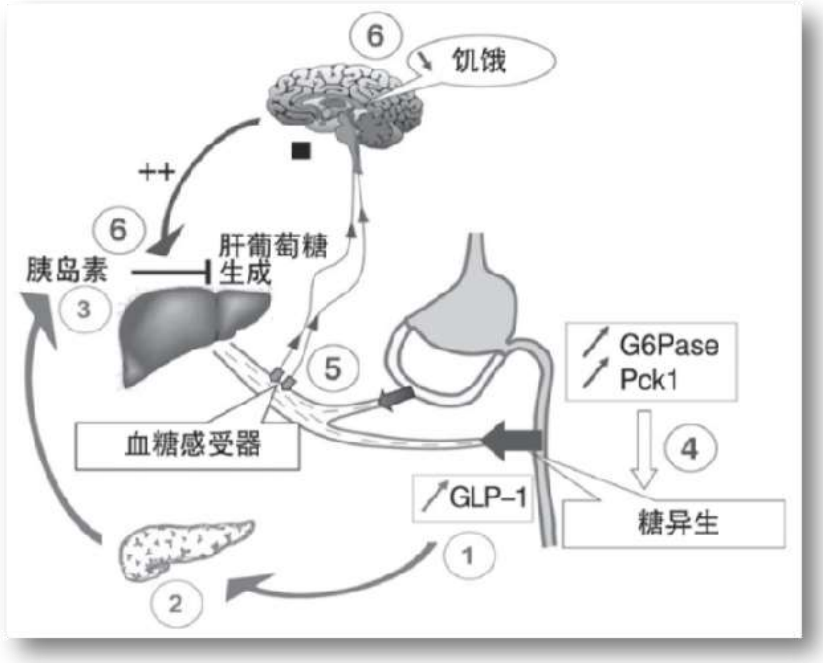
Diabetologia,2012,55:2445-55.

Surgery. 2008; 143(6):813-8.

SGLT1 as a Mediator of the Effect of GLP-1/GNG on Glucose Metabolism

- SGLT1 can regulate intestinal glucose-dependent GLP-1 expression remotely.
- SGLT1 may induce MBS to exert regulatory effects on gluconeogenesis(GNG) pathway.





Diabetes. 2015; 64(2): 370-382. Nutr Hosp. 2013; 28(Supl. 2):109-114. Curr Diab Rep. 2012; 12(2): 167-71. 中华肥胖与代谢病杂志. 2016; 2(2)：80-84.

Proposed: “SGLT1 Bridge” Hypothesis

The traditional theories of "enteric-insular islet axis (EIA)" and "gut-brain-liver axis (GBLA)" cannot perfectly explain the mechanism of gastrointestinal surgery in the treatment of diabetes. ——intermediate link? SGLT1, upstream of EIA and GBLA?

SGLT1 Bridge

SGLT1 may be the "bridge" between the "GBLA" and the "EIA", which is initiated by MBS, i.e. gastric bypass.

- ☐ **Intestinal glucose absorption is directly reduced**
- ☐ **“SGLT1-IGNG-GBLA-HGNG”： FPG declined**
- ☐ **“SGLT1-GLP-1-insulin”： postprandial glucose improved**

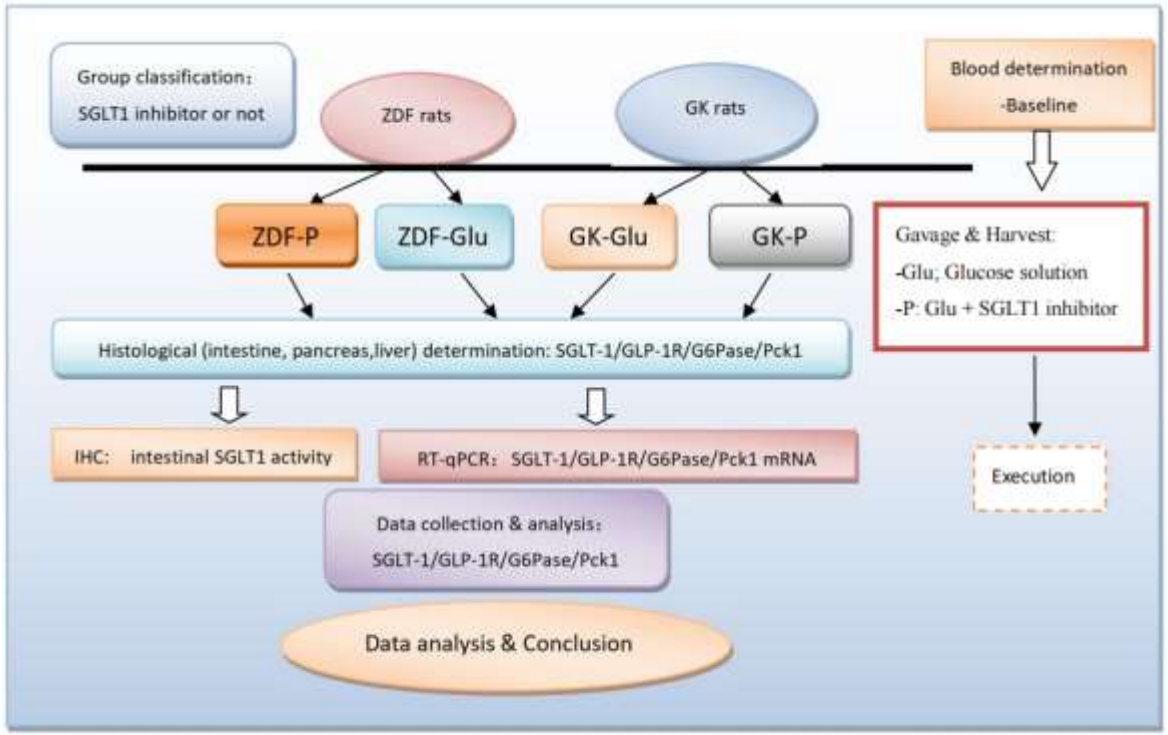
（ √: mRNA， √√: IHC+mRNA）

G6Pase and Pck1: key enzymes of gluconeogenesis



Procedure of rats experiment

Regulatory effects of SGLT1 inhibitor (Phlorizin) on different diabetic rats

- Regulatory effects of SGLT1 inhibitor on SGLT1 expression（-P vs -Glu）
- Regulatory effects of SGLT1 inhibitor on GLP-1R expression（-P vs -Glu）
- Regulatory effects of SGLT1 inhibitor on the expression of key enzymes of gluconeogenesis（-P vs -Glu）

Inhibition of SGLT1 Expression by Phlorizin in Diabetic Rats

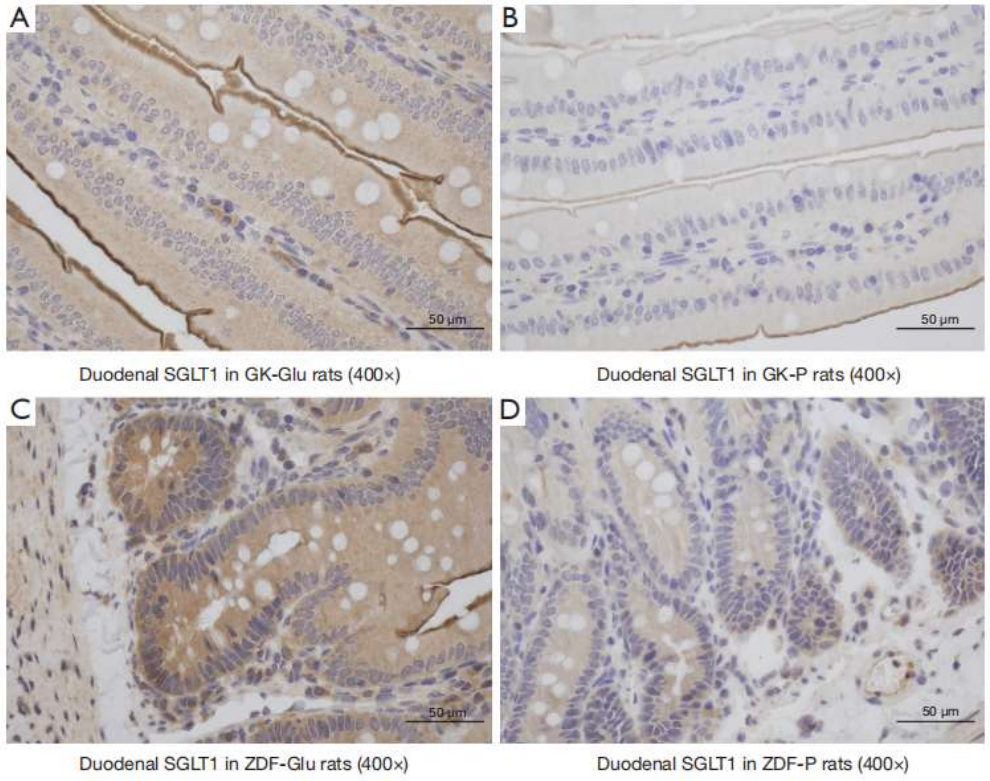


Fig. SGLT1 activity expression in the duodenum

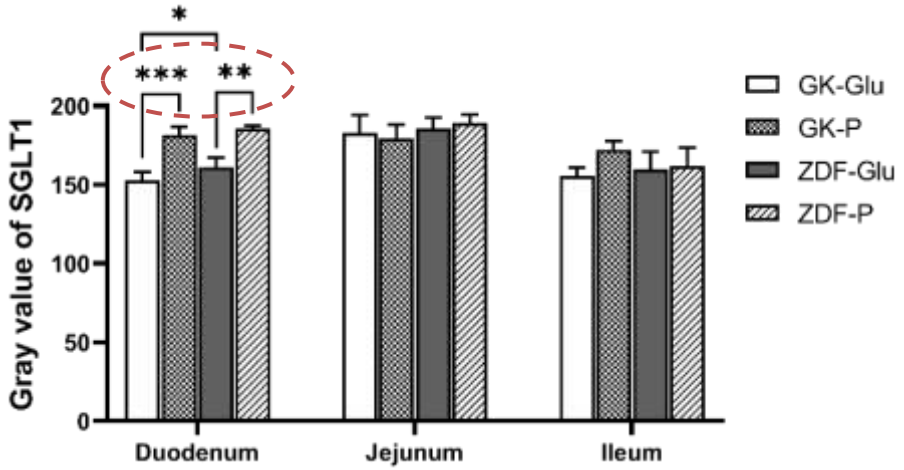

Fig. The activity of SGLT1 expression in the intestine

Data were analyzed using ANOVA with post hoc analysis with LSD's comparison test. *P<0.05, **P<0.01, ***P<0.001.

Plorizin inhibited duodenal SGLT1 activity in both GK rats ($p<0.001$) and ZDF rats ($p<0.001$).

Prerequisite obtained: SGLT1 inhibitors significantly inhibited intestinal SGLT1 expression.

Regulatory effects of Plorizin on GLP-1R expression (-P vs -Glu)

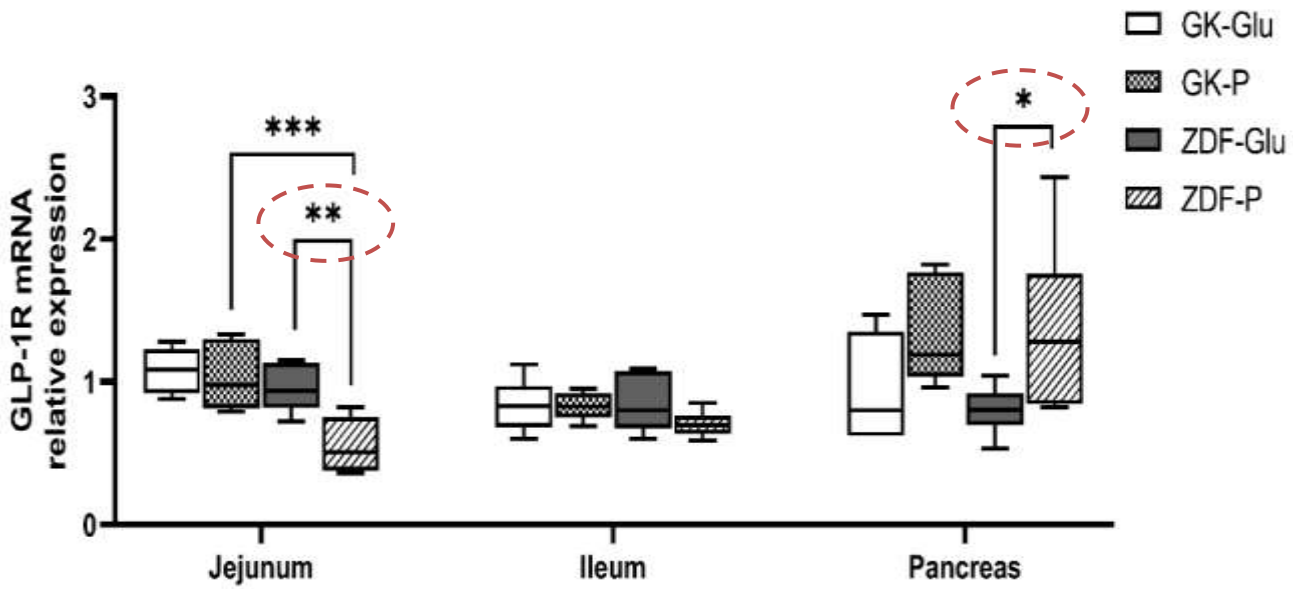

Fig. GLP-1R mRNA expression in the intestine and the pancreas

Data were analyzed using ANOVA with post hoc analysis with LSD's comparison test. *P<0.05, **P<0.01, ***P<0.001.

Regulatory effects of Plorizin on EIA were investigated in ZDF rats, not in GK rats.

- ✓ Down-regulated jejunal GLP-1R mRNA expression in ZDF rats(p=0.001)
- ✓ Up-regulated GlP-1R mRNA expression in pancreas of ZDF rats(p=0.021)。
- ➢ However, the regulatory effects of GLP-1R mRNA expressions in GK rats were not observed.

Regulatory effects of SGLT1 inhibitor on the expression of key enzymes of GNG （-P vs -Glu）

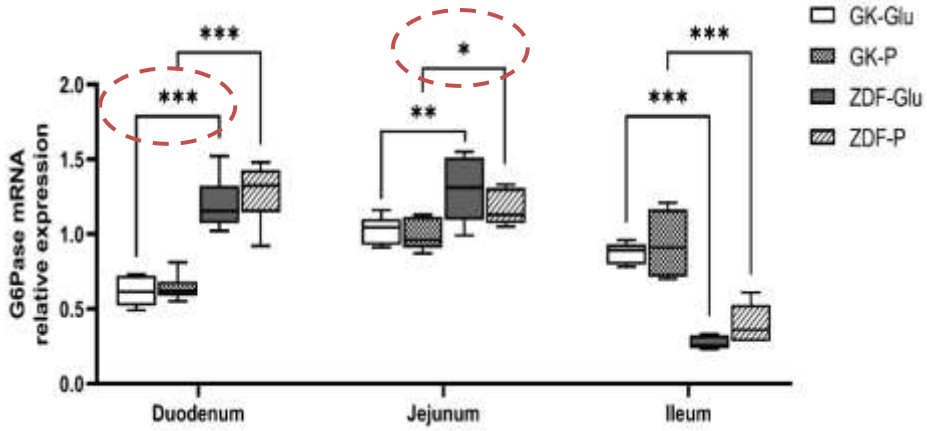

Fig. G6Pase mRNA expression in the intestine

Plorizin，*IGNG*↑

ZDF，SGLT1-IGNG；HGNG↓，SGLT1-GLBA pathway.

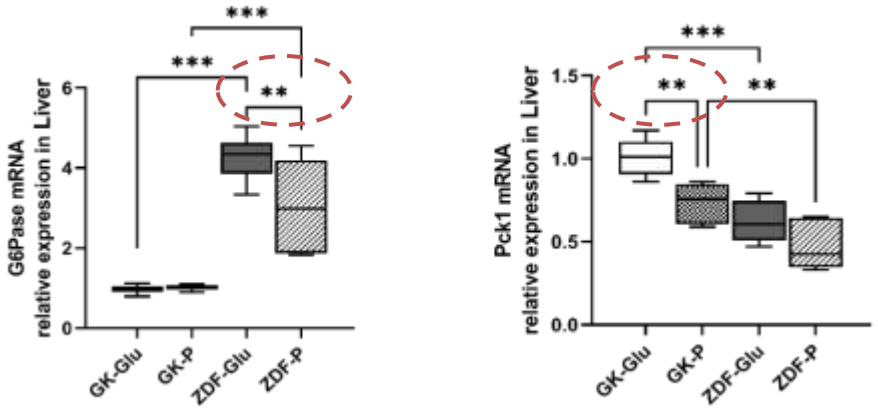

Fig. G6Pase & Pck1 mRNA expression in the liver

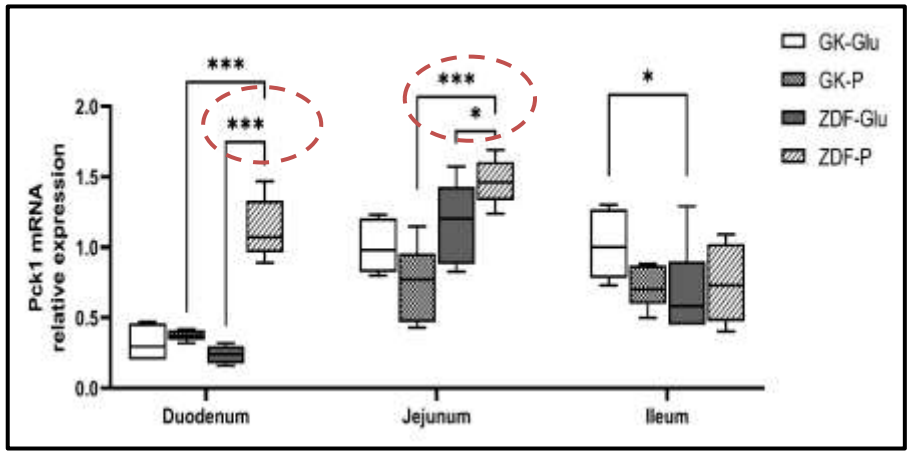

Fig. Pck1 mRNA expression in the intestine

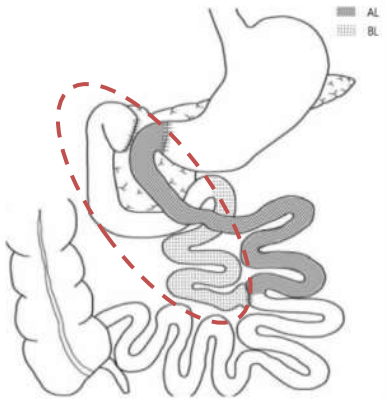
✓<u>Up-regulated</u> the duodenal(p= 0.000) and jejunal(p=0.038) Pck1 mRNA expression in ZDF rats, but not in that of GK rats.

✓<u>Down-regulated</u> <u>hepatic</u> G6Pase mRNA expression in ZDF rats (p=0.005) and hepatic Pck1 mRNA expression in GK rats(p=0.001). *[No changes in hepatic SGLT1 expression: "remote effects" (GBLA)]*

Summary



SGLT1 inhibitor

SGLT1 ↓

GLP-1R

- GK-rats:
- SGLT1-GLP-1R✗
- ZDF-rats:
- SGLT1-GLP-1R√

GLP-1R (PA) ↑

EIA

PA: Insulin ↑

ZDF & GK rats (DU)

Glu ↓

HGNG ↓

GBLA

IGNG

- ZDF-rats:
- SGLT1-IGNG√
- GK-rats:
- SGLT1-IGNG✗

IGNG↑
PGS: Glu

GBLA

Brain

- ✓ SGLT1 showed synergistic regulatory effects on the entero-insular axis (EIA) and the gut-brain-liver axis (GBLA), preliminarily validating the "SGLT1 bridge"hypothesis.
- ✓ The distinct expression of SGLT1 and its differentially regulatory effects on diabetic rats with different pathophysiological conditions may provide probable potential indications involved in the "Surgical Diabetes" that is supposed as the inclusion for diabetic surgery.

Surgical Diabetes
—Multiple factors, pathways related to SGLT1

PV: portal vein; VN: vagus nerve; IGNG: intestinal GNG; HGNG: hepatic GNG.

Conclusion & Prospect

- **“Surgical Diabetes” has been proved that exists with a specific pathophysiological condition strongly related to the “SGLT1 Bridge”, which might be independent of the clinical manifestation.**

- **Clinical factors (i.e. BMI, duration of diabetes) can predict diabetes remission, but specific indicators for “Surgical Diabetes” must focus on the therapeutic mechanisms of diabetes remission after MBS. [Phenomenon & Essence]**

- **If the "SGLT1 Bridge" is validated as an indication for "Surgical Diabetes" in humans , it could solve the bottleneck that limit the indications for diabetic surgery.**

Preoperitive Endoscopy Accessible!

Bypass Greater Again!

Thank You !
